

Giti.one ERP

Minimum viable product — English

Prepared by Poriya Sayafan. This document is not an ISO or PMI certificate.

1. What this is

Giti.one is a Node.js ERP in git. A purchase order is a promise. It is not the books. When goods are received or delivered, Giti.one posts inventory and a balanced journal — then AR, AP, and cash. ISO 9001, ISO/IEC 27001, and ISO 55001 records and a PMP map live in the same catalog.

Source: <https://github.com/psayafan/Giti.one-ERP> • Site: <https://psayafan.github.io/Giti.one-ERP/> • License: AGPL-3.0-or-later. The **Giti.one** name is a trademark of Poriya Sayafan.

This MVP is the path that posts and the records that the tests prove. A name in the catalog is not a working module.

2. Doctrine

1. One set of books. Debit equals credit.
2. A module is `list / add`. If it moves goods or money, it posts.
3. Documents (purchase order, sale order) are not execution. Receipt and delivery are.
4. ISO packs are records in the ERP, not a certification claim.
5. Catalog ids stay English. Labels are English and Persian.

3. What the MVP actually does

Buy → stock → sell → cash

The demo in `src/cli.js` (`seedDemo`) and `./setup.sh` runs this cycle:

Step	Document	What posts
1	Purchase order <code>po-1</code>	Promise only. No journal.
2	Receipt <code>r-1</code> (10 × 8.00)	Stock +10. Inventory debit 80, GRNI credit 80.
3	Sale order <code>so-1</code>	Promise only. No journal.
4	Delivery <code>d-1</code> (qty 3)	Stock −3. COGS debit 24, inventory credit 24.
5	Invoice <code>inv-1</code> (60.00)	AR debit 60, revenue credit 60.
6	Payment <code>pay-1</code> (60.00)	Cash debit 60, AR credit 60.

After the demo: on-hand 7 (SKU-1 / MAIN), cash 60, GRNI 80, inventory 56, trial **balanced**. Party names are vendor, customer, item, warehouse.

Other postings that already run

Action	Module	Books
Vendor bill (unmatched expense)	accounting.bills	Expense / AP
Vendor payment	accounting.payments with billId	AP / cash
Landed cost	buying.landedCosts	Inventory / AP
Warehouse transfer	stock.warehouseTransfers	Qty moves; inventory value unchanged
Inventory adjustment	stock.inventoryAdjustments	On-hand changes
Stock move	stock.stockMoves	Inbound / outbound qty

Receipts that name a purchase order cannot exceed remaining order qty. Deliveries cannot ship without stock and cannot exceed remaining sale-order qty.

4. ISO and PMP records

These are records and a map inside the catalog. They are not certificates.

Pack	What is in the MVP
ISO 9001:2015	Documents (Issued needs title and version), nonconformances, CAPA linked to an NC, internal audits, management reviews.
ISO/IEC 27001:2022	Users bound to roles, audit log on journal post, incidents (open / contained / closed), asset inventory.
ISO 55001:2024	Asset register (in-service / idle / disposed) and maintenance that names an asset.
PMP / PMBOK + ISO 21502	projects.projects.processGroup is initiating, planning, executing, monitoring, or closing. Charters, stakeholders, WBS, schedules, costs, communications, risks, and changes map on the same books.

PostgreSQL views in schema.sql read those rows from one table, erp_row.

5. How to run it

```
git clone https://github.com/psayafan/Giti.one-ERP.git
cd Giti.one-ERP
./setup.sh
```

That installs dependencies, runs tests, starts PostgreSQL when Docker is available, loads the demo, and prints the books. Persian CLI: ./setup.sh --lang fa.

Local UI (this machine only, not a hosted product):

```
npm start
# open http://127.0.0.1:3847
```

Bind is 127.0.0.1. Default port 3847 (GITI_PORT to change). Books first; catalog is list / add. English and Persian.

Without Docker the same books print in memory. Need: Node.js 20 or newer. Postgres from compose uses demo user giti on 127.0.0.1:5432 — demo only.

6. What the catalog is — and is not

Every module in `src/catalog.js` has list / add. That is the extension rule (see `AGENTS.md`). HR, POS, manufacturing orders, CRM lists, and similar rows are catalog slots until they post. Do not present them as a finished ERP.

This MVP is not a public HTTP product, not a bank, not an FP&A agent, and not an AI CRM. Feature requests: GitHub Issues or mail psayafan@hotmail.com.

7. Tests and files

`npm test` must pass. The buy–sell–cash cycle, supply postings, ISO links, PMP process groups, locale (English and Persian), local UI, and `erp_row` round-trip are covered.
